Topic 10

Graph and Circuit: From CS to EE applications

資料結構與程式設計 Data Structure and Programming

Sep, 2012

CS to EE? What does that mean?

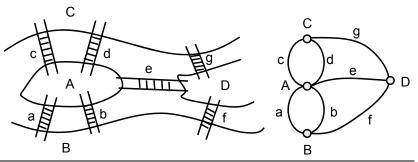

- Most people think that "Data Structure" is a CS class
 - A "must" subject for CS entrance exam
- In EE area, many problems can be either mapped as graphic problems, or resolved by graphic algorithms
 - e.g. Circuit netlist, network, etc.
 - Understanding graphic data structure and algorithms will be very helpful

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

The First Use of Graph

- ◆ Köigsberg Bridge Problem
 - Leonhard Euler, 1736
 - Starting at one land, is it possible to walk across all bridges exactly once and returning to the starting land area?

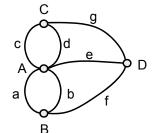

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

3

Eulerian Theorem

- There is a walk starting at any vertex, going through each edge exactly once and terminating at the starting vertex, iff the degree of each vertex is even.
 - → Eulerian walk

No Eulerian walk, since all 4 vertices are of odd degree.

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Definition of a Graph

- ◆ A graph, G(V, E)
 - V: a finite, nonempty set of vertices → V(G)
 - E: a set of pairs of vertices these pairs are called edges → E(G)
- 1. Undirected Graph
 - If every pair of vertices representing any edge is unordered
 - i.e. (u, v) and (v, u) represent the same edge

- Order of the pair of vertices matters
- <u, v>: 'u' is the tail and 'v' is the head
- e.g. A circuit is a directed graph

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

_

Terminologies

- ◆ Given 2 nodes u, v, and an edge (u, v)
 - u and v are called adjacent
 - The edge (u, v) is incident on vertices u and v
- → If <u, v> is a directed edge
 - u is adjacent to v, and v is adjacent from u

- ◆ Degree of a vertex
 - The number of edges incident to it
- → If the graph is directed
 - In-degree
 - The number of edges for which the vertex is the head
 - Out-degree
 - The number of edges for which the vertex is the tail

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Terminologies

- ◆ Path
 - A sequence of vertices in which each vertex is adjacent to the next one

• e.g. {
$$n_1$$
, e_1 , n_2 , e_2 , n_3 , e_3 , ..., e_{k-1} , n_k }

- ◆ Simple path
 - · All vertices in a path are distinct
- ◆ Length of a path
 - The number of edges in a path
- ◆ Loop (self-edge)
 - An edge with 2 identical end-points
- ◆ Cycle
 - A path with identical start and end points

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

7

Graph Properties

- ◆ Subgraph G(V', E') of G(V, E)
 - $\bullet \quad V' \subseteq V; \, E' \subseteq E$
- Simple graph
 - No loops and no two edges link the same vertex pair
- Multigraph
 - Not simple graph
- Weighted graph
 - Each edge is associated with some weight
- Hypergraph
 - An extension of a graph where edges may be incident to any number of vertices

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

R

Complete Graph

- ◆ Complete graph
 - Each vertex is adjacent to all the other vertices in the graph
 - For complete graph with n vertices
 #edges = n (n 1) / 2
- Clique of a graph
 - Complete subgraph
- ◆ Complement G(V', E') of a graph G(V, E)
 - $V' = V; E \cap E' = \emptyset$
 - $G(V, E \cup E')$ is a complete graph

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

9

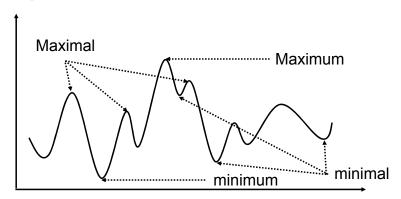

Undirected Graph Properties

- Two vertices u and v are said to be connected
 - Iff there a path from u to v
- A graph is said to be connected
 - Iff every vertex pair is connected
 - → A tree is a connected acyclic graph
- A connected component (or simply component) of a graph
 - A <u>maximal</u> connected subgraph

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

(FYI) Maximal vs. Maximum

- In many problems, finding Maximum/minimum is very hard
 Finding maximal/minimal is the only possibility
- · How to find a better Maximal/minimal?

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

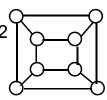

11

Undirected Graph Properties

- ◆ Cutset
 - A minimal set of edges whose removal from the graph makes the graph disconnected

- ◆ Bipartite graph
 - Vertex set can be partitioned into 2 subsets such that each edge has end-points in different subsets

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

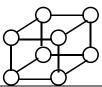

Undirected Graph Properties

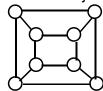

- ◆ Plannar graph
 - A diagram on a plane surface such that no two edges cross

- ◆ Two graphs are isomorphic
 - There is a one-to-one correspondence between their vertex sets and preserves adjacency

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

13

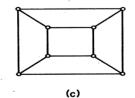

Some interesting plannar graphs

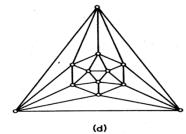

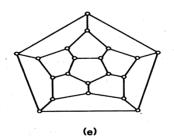

(a)

(b)

(a) The tetrahedron; (b) the octahedron; (c) the cube; (d) the icosahedron; (e) the dodecahedron

Undirected Graph Properties

- Each undirected graph can be characterized by four numbers
- 1. Clique number $\omega(G)$
 - The cardinality of its largest clique, called clique number
- 2. Chromatic number $\chi(G)$
 - The minimum number of colors needed to color the vertices, such that no edge has endpoints with the same color
 - e.g. A bipartite graph is a 2-colorable graph

Property: $\omega(G) \leq \chi(G)$

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

15

Undirected Graph Properties

- Clique cover number κ(G)
 - A graph is said to be partitioned into cliques if its vertex set is partitioned into (disjoint) subsets, each one including a clique
 - The cardinality of a minimum clique partition is called Clique cover number
- Stability number α(G)
 - A stable set, or independent set, is a subset of vertices with the property that no two vertices in the stable set are adjacent
 - The stability number is the cardinality of its largest stable set
 - A coloring of a graph is a partition of the vertices into subsets, such that each is a stable set

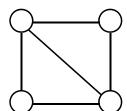

Property: $\alpha(G) \le \kappa(G)$

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Perfect Graph

- ◆ A graph is said to be perfect iff
 - $\omega(G) = \chi(G)$ (clique = chromatic)
 - $\alpha(G) = \kappa(G)$ (stability = clique covering)

$$\omega(G) = \chi(G) = 3$$

$$\alpha(G) = \kappa(G) = 2$$

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

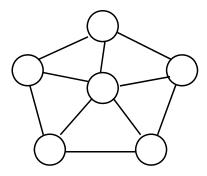

17

Appendix

◆ Example:

Clique number $\omega(G) \leq Chromatic number \chi(G)$

Stability number $\alpha(G) \subseteq Clique cover number \kappa(G)$

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Directed Graph Properties

- A digraph is said to be strongly connected
 - Iff for every pair of distinct vertices u and v, there is a path from u to v, also from v to u

- Strongly connected component (SCC)
 - Maximal subgraph that is strongly connected
 - If a graph is strongly connected, it has only one SCC
 - Linear time algorithm for finding SCCs:
 Robert E. Tarjan, Depth-first search and linear graph algorithms, SIAM Journal on Computing, 1(2):146-160, 1972.

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

19

Directed Acyclic graph (DAG)

- A directed graph that has no cycle
- Can represent partially ordered set
 - A vertex v is a successor (descendant) of a vertex u
 - If there is a path from u to v
 - Called direct successor if the path is an edge
 - Predecessor (ancestor)
- Polar DAG
 - A DAG with 2 distinguished vertices
 - A source and a sink
 - All vertices are reachable from the source
 - Sink is reachable from all the vertices
 - A generic polar DAG may have multiple sources and sinks

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Partially vs. Totally Ordered Set

- A relation "≤" is a partial order on a set S if it has:
 - 1. Reflexivity: $a \le a$ for all $a \in S$
 - 2. Antisymmetry: $a \le b$ and $b \le a$ implies a = b.
 - 3. Transitivity: $a \le b$ and $b \le c$ implies $a \le c$
- ◆ A relation "≤" is a total order on a set S if it has the above 3 properties and the following:
 - 4. Comparability (trichotomy law):For any a, b ∈ S, either a ≤ b or b ≤ a

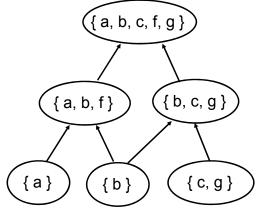

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

21

A Partial Order Example

 The "containment" relation of a set is a partial order

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Graphic Algorithms

- The importance of learning "graphs" is that many practical problems can be modeled and then solved by standard/well-known graphic algorithms
 - 1. Breadth-First Search and Depth-First Search
 - 2. Topological Sort
 - 3. Strongly Connected Component
 - 4. Shortest and Longest Path Algorithms
 - 5. Minimum Spanning Tree
 - 6. Maximum Flow and Minimum Cut
- Please refer to "Algorithm" book or class for more information
 - We may cover some of them if we have time...

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

23

Graph Traversal

- In many graph (DAG) applications, it is important to go through every vertex in certain order
 - e.g. checkSum(), simulate(), etc
- Topological order
 - An order sorted by certain relationship of adjacent vertices
 - e.g.
 - For each vertex, it has higher order than all of its predecessors, and lower order than all of its successors

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Depth-First Traversal (Take 1)

```
void
Graph::dfsTraversal(const List<Node*>& srcList)
   for_each_source(node, srcList)
      node->dfsTraversal(_dfsList);
// post order traversal
void Node::dfsTraversal(List<Node *>& dfsList)
   for_each_successor(next, _successors)
      next->dfsTraversal(dfsList);
   dfsList.push_back(this);
```

Any Problem??

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

25

Depth-First Traversal (Take 2)

```
void
Graph::dfsTraversal(const List<Node*>& srcList)
   for_each_source(node, srcList)
     node->dfsTraversal(_dfsList);
// post order traversal
void Node::dfsTraversal(List<Node *>& dfsList)
   for_each_successor(next, _successors)
      if (!next->isMarked()) {
        next->setMarked();
        next->dfsTraversal(dfsList);
   dfsList.push_back(this);
}
              Any Problem??
```

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Depth-First Traversal (Take 3)

```
Graph::dfsTraversal(const List<Node*>& srcList)
{
    for_each_source(node, srcList)
        node->dfsTraversal(_dfsList);
    for_each_node(node, _dfsList)
        node->unsetMarked();
}
// post order traversal
void Node::dfsTraversal(List<Node *>& dfsList)
{
    for_each_successor(next, _successors)
        if (!next->isMarked()) {
            next->setMarked();
            next->dfsTraversal(dfsList);
}
dfsList.push_back(this) Any Problem??
```

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

27

Depth-First Traversal (Take 4)

 Use this method to replace "setMarked()" functions in graph traversal problems

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Depth-First Traversal (Take 4)

```
void
Graph::dfsTraversal(const List<Node*>& srcList)
{
   Node::setGlobalRef();
   for_each_source(node, srcList)
        node->dfsTraversal(_dfsList);
}
// post order traversal
void Node::dfsTraversal(List<Node *>& dfsList)
{
   for_each_successor(next, _successors)
     if (!next->isGlobalRef()) {
        next->setToGlobalRef();
        next->dfsTraversal(dfsList);
     }
   dfsList.push_back(this);
}
Any Problem??
```

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

29

Depth-First Traversal (Take 5)

```
Graph::dfsTraversal(const List<Node*>& srcList)
   Node::setGlobalRef();
   for_each_source(node, srcList)
     node->dfsTraversal(_dfsList, _fbList);
// post order traversal
void Node::dfsTraversal
(List<Node *>& dfsList, list<Node*>& fbList)
   for_each_sucecessor(next, _successors)
      if (!next->isGlobalRef()) {
        next->setToGlobalRef();
        next->setActive();
        next->dfsTraversal(dfsList, fbList);
        next->unsetActive();
      else if (next->isActive()) fbList.push_back(this, next);
   dfsList.push_back(this);
                                // not push_back(next); why?
}
```

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Breath-First Traveral

How about the "marked" and "loop" Issues ??

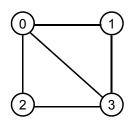

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

31

Graph Implementation (1)

Adjacency Matrix
class Graph
{
 bool _adjacency[n][n];
};

- For undirected graph → upper triangle
- How to perform traversal?
- Difficult to implement various graphic algorithms
- Could be a sparse matrix
- Complexity can be as high as O(n²)

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Graph Implementation (2)

- Adjacency List class Graph List<int> *_headNodes; _numNodes; 0 1 1 1 1 0 0 1 **}**; 1 0 0 1
 - Better for sparse matrix
 - Require n _headNodes and 2*e ListNodes
 - (u, v) and (v, u) redefined
 - Some operations may still be as expensive as O(n + e)

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

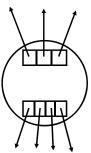

33

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Graph Implementation (4)

◆ Two dynamic arrays
 class Node
{
 Array<Node *> _successors;
 Array<Node *> _predecessors;
};
 class Graph
{
 Array<Node *> _nodes;
 // Array<Node *> _sinks;
 // Array<Node *> _sources;
};

- Memory usage is about the same (n + 2 * e)
- A more intuitive implementation

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

35

Graph Implementation (5)

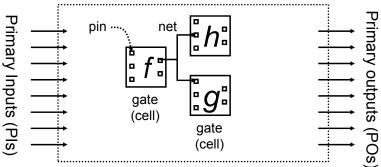

Data Structure and Programming

};

Prof. Chung-Yang (Ric) Huang

Circuit

 A directed diagram for representing the current flow of an electronic design

- h and g are f's fanouts
- ◆ f is h's and g's fanin

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

37

Circuit Implementation (1)

```
Cell-based implementation (1)
class Gate
{
                    _type;
   GateType
   GateFlag
                    _flag; // visited, etc
   Array<Gate *>
                    _faninList;
   Array<Gate *>
                    _fanoutList;
};
class Circuit
{
   Array<Gate *>
                    _piList;
   Array<Gate *>
                    _poList;
   Array<Gate *>
                    _totalList;
};
```

- · Gate::_type is to distinguish different functionalities
 - Drawback: usually need a BIG switch in codes

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Circuit Implementation (2)

```
Cell-based implementation (2)
class Gate
{
  GateType
  GateFlag
                   _flag;
  Array<Gate *>
                   _faninList;
                  _fanoutList;
  Array<Gate *>
class And : public Gate
{
};
class Circuit
                   _piList;
   Array<Gate *>
                   _poList;
  Array<Gate *>
   Array<Gate *>
                   _totalList;
};
```

Data Structure and Programming

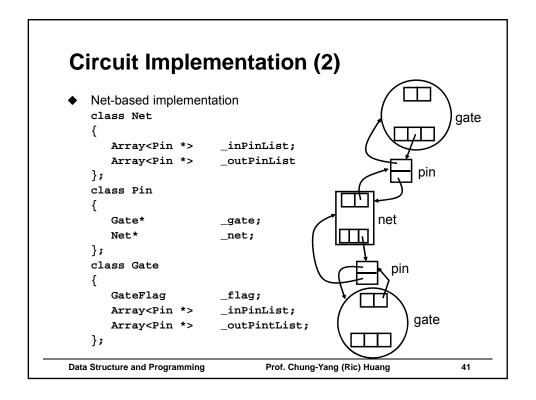

Prof. Chung-Yang (Ric) Huang

39

Virtual Functions for Different Types of Gates

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

Circuit Implementation (3)

- **♦** AND-Inverter Graph (AIG)
- ◆ All the Boolean functions can be represented by "And: ∧" and "Inverter: ¬"
 - e.g. $OR(a, b) = \neg(\neg a \land \neg b)$
- As for circuit implementation, it is better to have simpler data structure
 - AIG is enough
 - Two classes: AndGate and InvGate?
 - InvGate is kind of unnecessary...
 - One class: NandGate?
 - Still need an object to represent an Inverter
 - Solution: AndGate with (optional) inverted inputs

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

AIG Implementation

```
class AigGate {
   Array<AigGateV> _faninList;
                   _ref;
   size_t
   static size_t
                    _globalRef_s
};
class AigGateV {
   AigGateV(AigGate* g, size_t phase):
      \_gateV(size\_t(g) + phase) \{ \}
   AigGate* gate() const {
     return (AigGate*)(_gateV & 0xFFFFFFC); }
  bool isInv() const { return (_gateV & 0x1); }
   size_t
                    _gateV;
};
```

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

43

AIGER Format

- ◆ An simplified, well-accepted AIG format
 - Documents and source codes available at: http://fmv.jku.at/aiger/
- Two versions
 - ASCII format: text format ← HW #6
 - Binary format: more compact representation
 - → In HW#6 and final project, we will handle ASCII format only

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

- ASCII format contains several sections
 - Header
 - Inputs
 - Latches // omitted in HW#6
 - Outputs
 - ANDs
 - Symbols
 - Comments
- Except for header, any of the above sections can be omitted if it is not necessary
 - However, their relative order cannot be altered

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

45

AIGER ASCII Format

- ◆ Header
 - [Syntax] aag M I L O A
 - aag: specify ASCII AIG format
 - · [cf] aig: specify binary format
 - M: maximal variable index
 - I, L, O, A: number of inputs, latches, outputs, AND gates
 - [Example] aag 7 2 0 2 3
 - [Note]
 - Exact ONE space before M, I, L, O, A
 - "A" must be immediately followed by a "new line" char.
 - If all variables are used and there are no unused AND gates, then M = I + L + A.

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

- Variables and Literals
 - Each input, latch, and AND gate is assigned with a distinct variable ID (i.e. an unsigned number)
 - Between [1, M]
 - Variable 0 means constant FALSE.
 - The input, latch, and AND variable IDs can be arbitrary. No one is necessary bigger/smaller than the other.
 - A "literal" is a positive or negative form of a variable
 - Let v be the ID of a variable, than the literal (2v) and (2v+1) stands for the positive and negative forms of the variable, respectively
 - e.g. Literal 12 is the positive form of variable 6
 Literal 1 stands for constant TRUE

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

47

AIGER ASCII Format

- Inputs
 - [Syntax] <inputLiteralID>
 - [Example] 2
 - [Note]
 - Each line defines exactly one input, which is represented as a literal ID
 - Inputs are non-negative, so the literal IDs must be even numbers

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

- ◆ Latches
 - [Syntax] <currStateLiteralID> <nextStateLiteralID>
 - [Example] 8 15
 - [Note]
 - Each line defines exactly one latch, which containts the current state literal ID followed by the next state ID
 - Currnet states are non-negative (as inputs), so their literal IDs must be even numbers
 - Next states can be inverted (as outputs), so their literal IDs can be positive or negative

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

49

AIGER ASCII Format

- Outputs
 - [Syntax] <outputLiteralD>
 - [Example] 9
 - [Note]
 - Each line defines exactly one output, which is represented as a literal ID
 - Outputs can be inverted, so their literal IDs can be even or odd

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

- ◆ AND gates
 - [Syntax] <LHS> <RHS1> <RHS2>
 - [Example] 12 7 15
 - [Note]
 - Each line defines exactly one AND gate, which containts the LHS literal followed by exactly two RHS literals
 - LHS literals must be even, and the RHS literals can be even or odd (i.e. non-inverted or inverted)

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

51

AIGER ASCII Format

- Symbols
 - [Syntax] [ilo]<position> <symbolicName>
 - [Example] i0 reset

o1 done

- [Note]
 - Each line defines exactly one symbolic name for inputs, latches, or outputs
 - There is at most ONE symbolic name for each input, latch, or output
 - <position> denotes the position of the corresponding input/latch/output is defined in it section. It counts from 0.
 - Symbolic name can contain any printable character, except for "new line"
 - [Note] White space and numbers are allowed in names

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

- Comments
 - [Syntax] c

[anything]...

[Example] c

Game over!!

- [Note]
 - The comment section starts with a *c* character followed by a new line. The following lines are comments.

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

53

Notes on AIGER Format

- No leading or trailing spaces in each line
- ◆ No empty line
- "New line" character must present at the end of each line
- All parsed tokens in the same line, except for comments, must be separated by exactly ONE space character
- Identifying undefined literals and checking for cyclic dependencies have to be done explicitly in ASCII format parser

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang

```
AIGER Examples
    Empty circuit
    aag 0 0 0 0 0
                        // header
    And gate
                        // header
    aag 3 2 0 1 1
    2
                        // input 0
   4
                        // input 1
    6
                        // output 0
    624
                        // AND gate 0 = 1 & 2
    Or gate
    aag 3 2 0 1 1
                        // input 0

Some notes about HW#6

- ◆ Topic: An AIGER parser
 - Parse an AIGER netlist file into a circuit data structure (a DAG)
 - Note: Error handling can be VERY complicated... Try to work on "good" circuits first!!
 - Check for floating/undefined variables
 - Check for cyclic conditions
 - Report circuit statistics
 - Report gate connections
 - Perform logic simulations
 - Output AIG file

Data Structure and Programming

Prof. Chung-Yang (Ric) Huang
